

Assignment Day – 4

- 1. Open your own laptop or desktop (or use an online PC hardware simulator if you don't have access to a real system) and identify the GPU model installed. Write down the GPU's brand, model number, and whether it is integrated or dedicated.**

GPU Details

- Laptop Brand: HP Victus
- GPU Brand: NVIDIA
- GPU Model: NVIDIA GeForce RTX 2050
- GPU Type: Dedicated Graphics Card

2. Take a clear photo or screenshot of the cooling system (fan, heatsink, or liquid cooling setup) inside your PC or from a PC hardware simulator. Label the main cooling components and briefly describe their function.

3. Create a comparison table listing at least 3 differences between air cooling and liquid cooling systems for GPUs, including factors like cost, efficiency, and maintenance.

Factor	Air Cooling	Liquid Cooling
Cost	Less expensive and affordable.	More expensive due to additional components.
Cooling Efficiency	Good for normal gaming and everyday use.	Better cooling for high-performance gaming and overclocking.
Maintenance	Very low maintenance; only fan cleaning is needed.	Requires more maintenance and checking for leaks or coolant issues.
Noise Level	Fans may become noisy under heavy load.	Usually quieter because heat is transferred through liquid.
Installation	Easy to install and replace.	More complex to install and requires extra space.
Best For	Casual gamers and regular PC users.	Enthusiasts, content creators, and high-end gaming PCs.

- 4. Imagine you are building a gaming PC for streaming IPL matches and playing graphics-heavy games. Choose between air cooling and liquid cooling for your GPU, and justify your choice in 3-4 sentences based on your research.**

I would choose liquid cooling for my gaming PC. It keeps the GPU cooler while playing heavy games and streaming IPL matches at the same time. It is also quieter than air cooling and gives better performance during long gaming sessions. Although it costs more, it is a good choice for a powerful gaming PC.
